

SEO AUDIT & ACTION PLAN

Why servedubai.com isn’t ranking yet — and our plan to fix it

This is a summary of our technical review of the website. The good news first: there is **no Google penalty**, and the website’s content and structure are genuinely strong. The ranking problem is a small number of fixable technical issues left over from the old hacked WordPress site and its migration. Below is what we found and the work we’ll do.

No Penalty	~4 Lakh	Strong	3 Fixes
Google Manual Actions: clean	spam URLs from old hack	on-page content & structure	blocking technical issues

WHY THE WEBSITE ISN'T RANKING

The root cause in plain words

- The old website was **hacked**, which created ~4 lakh fake spam pages that Google still remembers.
- When we moved to the new website, those spam pages were **blocked the wrong way** — so Google can’t remove them, and they keep wasting Google’s attention on junk instead of your real pages.
- The old page links were **not redirected** to the new ones, so years of ranking history were lost.
- **Good news:** the actual website content, local area pages, and setup are solid. No rewriting needed — we mainly fix the plumbing and then grow.

ISSUES WE FOUND

Technical audit findings

Issue	What it means	Priority
Spam pages can’t be removed	Old hack URLs are blocked in a way that stops Google from de-listing them — they linger and waste crawl budget.	CRITICAL
Old links not redirected	Previous WordPress URLs return “page not found,” so old ranking strength isn’t passed to the new pages.	CRITICAL
Spam-blocking code flaw	The rule that removes spam pages is built in a way that can fail intermittently and needs correcting.	CRITICAL
Business listings mismatch	Old Google/Facebook listings show a different phone number than the website — confuses local ranking.	HIGH
Schema & details to polish	Business address and structured data can be tightened for richer Google results.	MEDIUM
No service-area landing pages	Missing “service + specific area” pages — the easiest, highest-intent traffic to capture.	GROWTH

OUR ACTION PLAN

What we’ll do, in phases

We tackle the blocking technical issues first, then build growth on top of them.

PHASE 0	Critical technical fixes	Week 1
● Unblock the old spam URLs so Google can finally remove them ● Add 301 redirects from all old links to the new pages (recover lost ranking) ● Fix the spam-blocking code flaw ● Submit a clean sitemap and request fresh indexing of key pages		
PHASE 1	Listings & schema polish	Week 1–2
● Make phone number identical everywhere (website = source of truth) ● Consolidate duplicate Facebook pages into one ● Strengthen structured data for richer Google results ● Validate every page in Google’s Rich Results test		
PHASE 2	Service-area landing pages	Week 2–6
● Build “service + area” pages (e.g. Sofa Cleaning in Dubai Marina) ● Start with top services × top Dubai areas — highest buyer intent ● Unique local content + internal links on each ● Target: grow from ~10 to 50–100+ ranking keywords		
PHASE 3	Google Business & reviews	Parallel
● Optimise Google Business Profile (services, areas, hours, photos) ● Set up a steady customer-review process ● Build consistent local business citations		
PHASE 4	Content & AI visibility	Week 4+
● Add a helpful blog answering common customer questions ● Improve visibility in AI answers (ChatGPT, Google AI) ● Earn local backlinks for authority		

WHAT TO EXPECT

Realistic timeline

- **Days 1–7:** technical fixes go live — Google starts cleaning up spam and re-reading the site.
- **Weeks 4–8:** spam pages drop off; old ranking strength flows to the new pages; first traffic returns.
- **Months 2–4:** service-area pages + Google Business drive steady keyword growth and organic leads.

Note: There is no penalty, so recovery is straightforward — but not instant. Google re-crawls a large site gradually. The fixes are quick; the payoff compounds over the following weeks.
